

Essential Parts

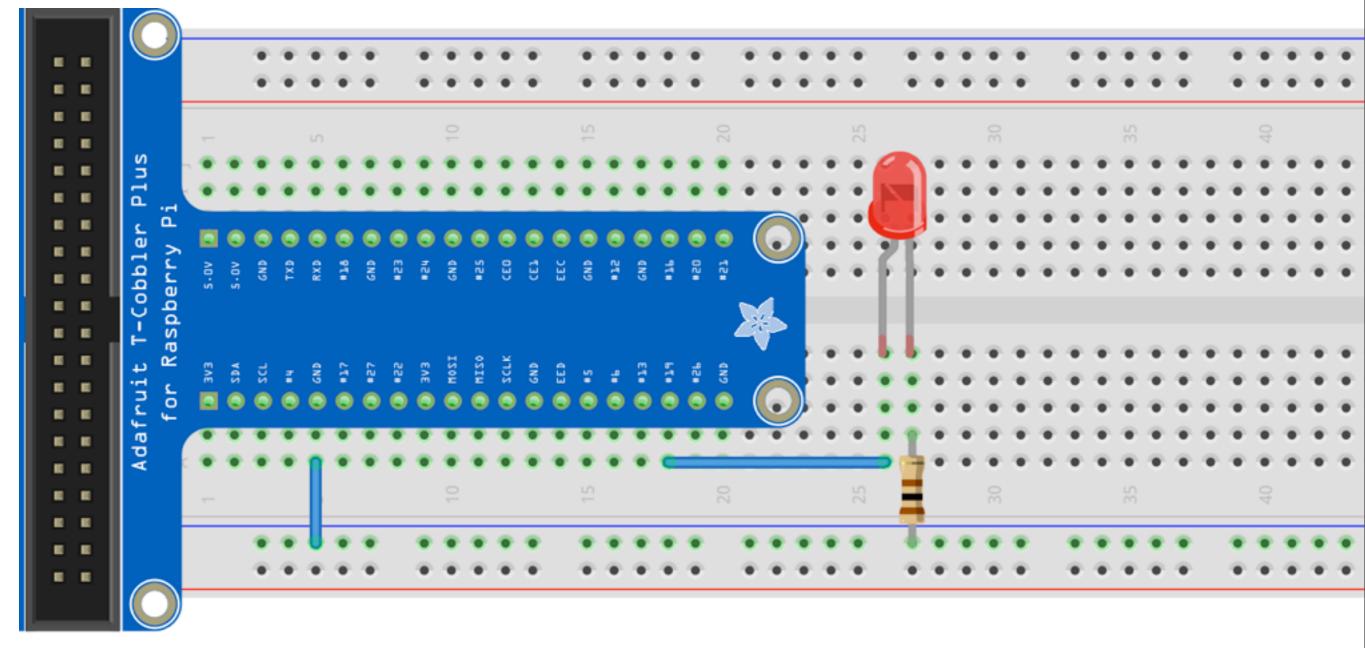

- Network Cable
- •µUSB Power Cord
- µSD Card (already installed)

```
dmduser$ ssh pi@172.16.36.XXX
pi@raspberrypi ~ $ sudo python
Python 2.7.3 (default, Mar 18 2014, 05:13:23)
[GCC 4.6.3] on linux2
Type "help", "copyright", "credits" or "license" for more information.
>>>
```

Connect Cable to RasPi towards board Cable only fits into Breadboard I way

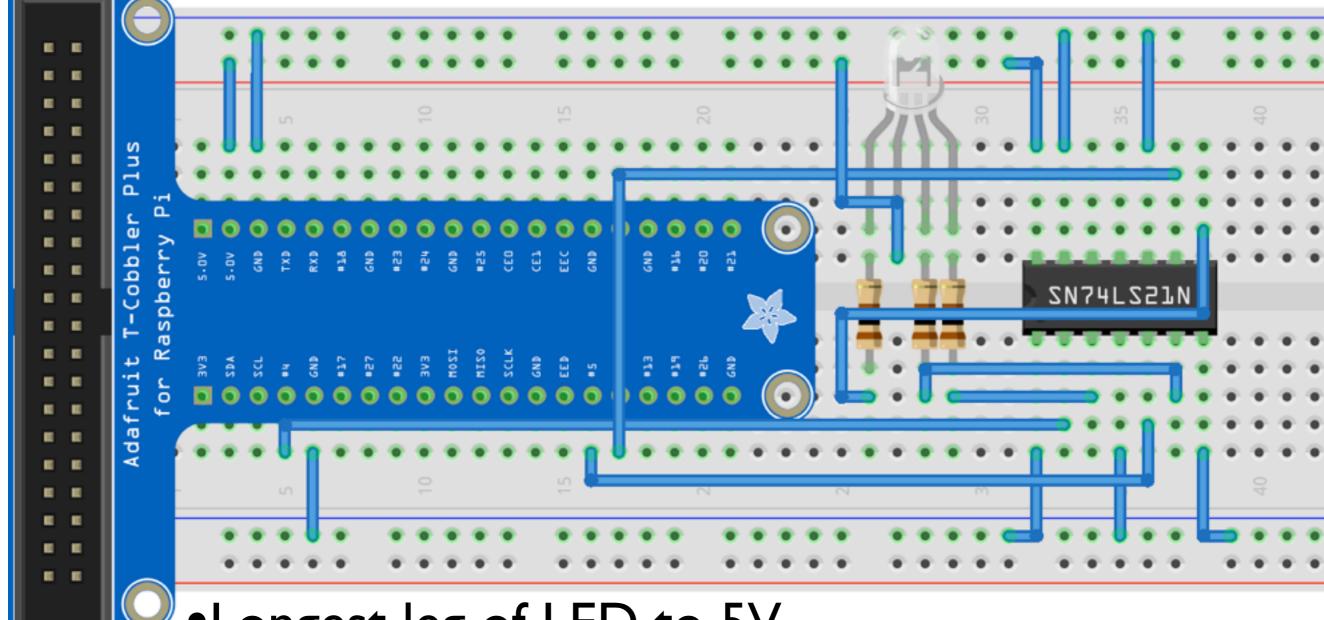

GPIO & Red LED

- Long leg of LED to Pin 13
- •Short leg to resistor, then to Ground

GPIO & Red LED

```
pi@raspberrypi ~ $ sudo python
>>> import RPi.GPIO as GPIO
>>> GPIO.setmode(GPIO.BCM)
>>> GPIO.setup(13, GPIO.OUT)
>>> GPIO.output(13, True)
```

- Longest leg of LED to 5V
- Other legs to Resistors, then Level Shifter
- •Level Shifter inputs to Pins 4, 5, & 6
- •5 Ground lines on Level Shifter

```
>>> GPIO.setup(4, GPIO.OUT)
>>> GPIO.setup(5, GPIO.OUT)
>>> GPIO.setup(6, GPIO.OUT)
>>> GPIO.output(4, True)
>>> GPIO.output(5, True)
```

```
>> r = GPIO.PWM(6, 100)
>>> r.start(50)
>>> r.ChangeDutyCycle(100)
>>> GPIO.output(5, False)
>>> g = GPIO.PWM(5, 100)
>>> g.start(50)
>>> b = GPIO.PWM(4, 100)
```

Atom & rmate

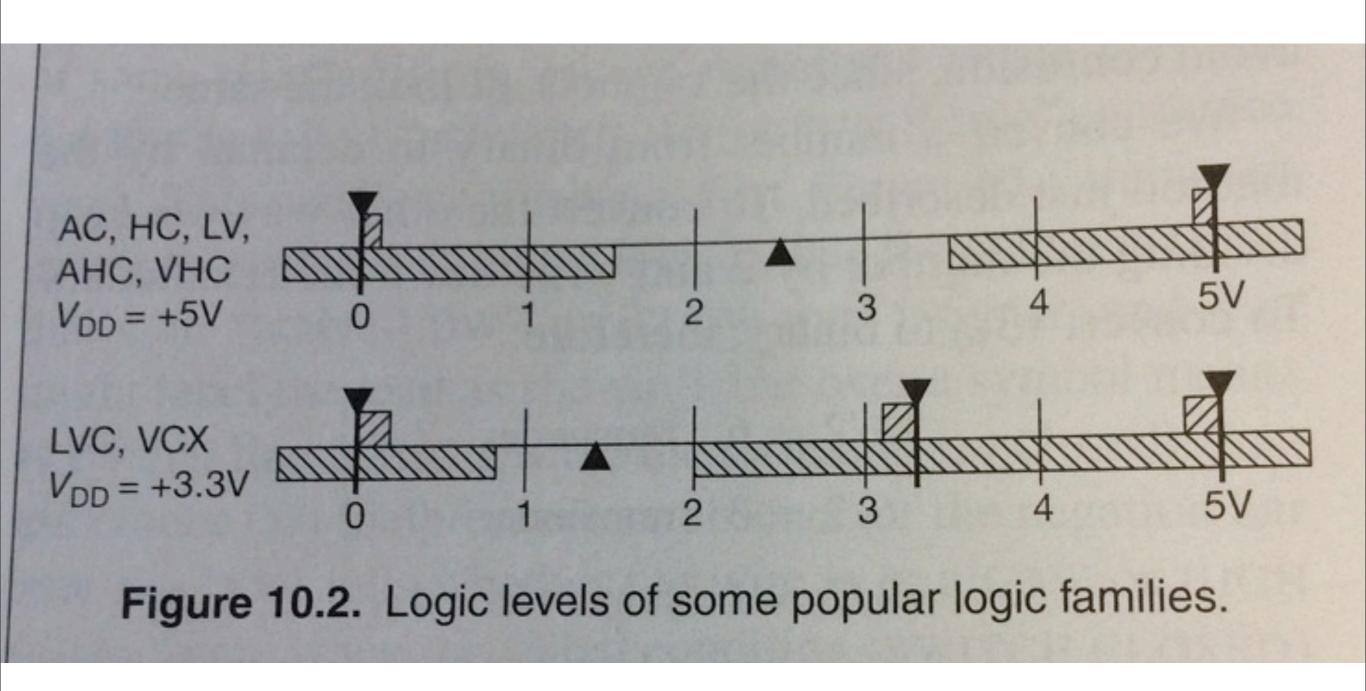

Atom text editor (on Mac)
Packages menu > Remote Atom > Start Server

dmduser\$ ssh -R 52698:localhost:52698 pi@172.16.36.XXX pi@raspberrypi ~ \$ rmate rgb.py

```
import RPi.GPIO as GPIO
    GPIO.setmode(GPIO.BCM)
    GPIO.setup(4, GPIO.OUT)
    GPIO.setup(5, GPIO.OUT)
    GPIO.setup(6, GPIO.OUT)
8
    b = GPIO.PWM(4, 100)
    g = GPIO.PWM(5, 100)
10
    r = GPIO.PWM(6, 100)
11
12
    g.start(50)
13
    r.start(100)
    b.start(0)
14
```

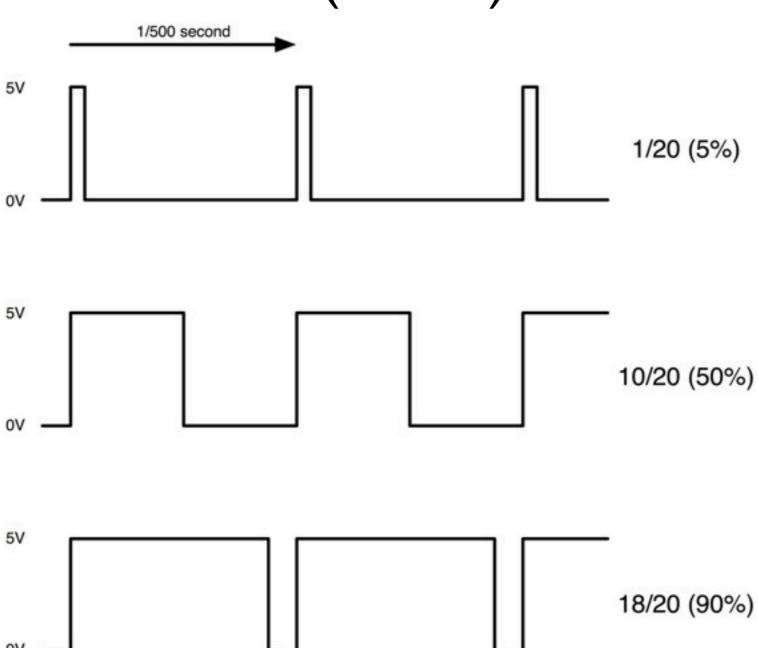

Logic Voltage Levels

What V counts as True?

© Horowitz & Hill, 2015

Pulse Width Modulation (PWM)

© Simon Monk https://learn.adafruit.com/assets/3652

Photoresistor, ADC, & SPI Preliminaries

- sudo aptitude install python-pip python-dev
- sudo pip install spidev
- sudo raspi-config
- Advanced >> turn on SPI, I2C
- Reboot

Photoresistor, ADC, & SPI Big Ideas

- Take Input from dials, sensors, people, world
- Most sensors are analog (or SPI / I²C)
- Fewer wires more logic at each end
- Lots of chips speak SPI

SPI

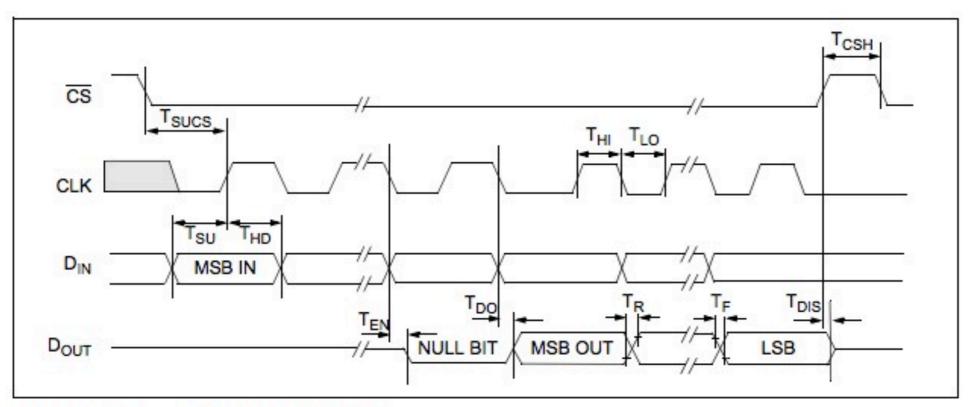

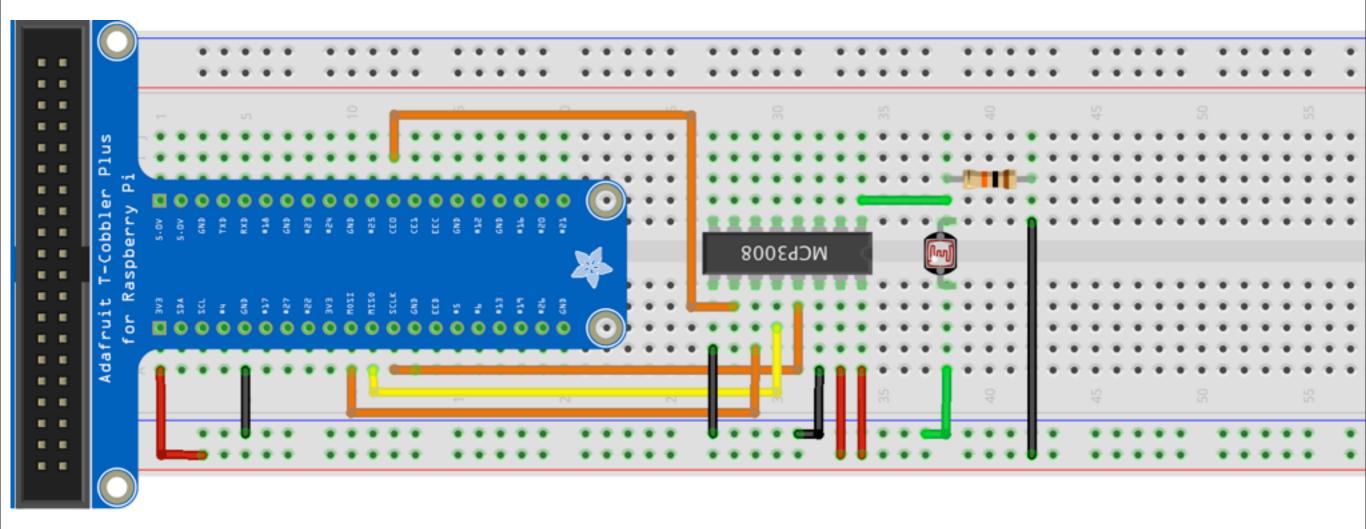

FIGURE 1-1: Serial Interface Timing.

© 2008 Microchip Technology Inc.

DS21295D-page 5

- Chip Select Pin one per chip, other pins shared
- Clock read data on rising edge of clock
- MOSI from RasPi to ADC
- MISO from ADC to RasPi

Photoresistor, ADC, & SPI

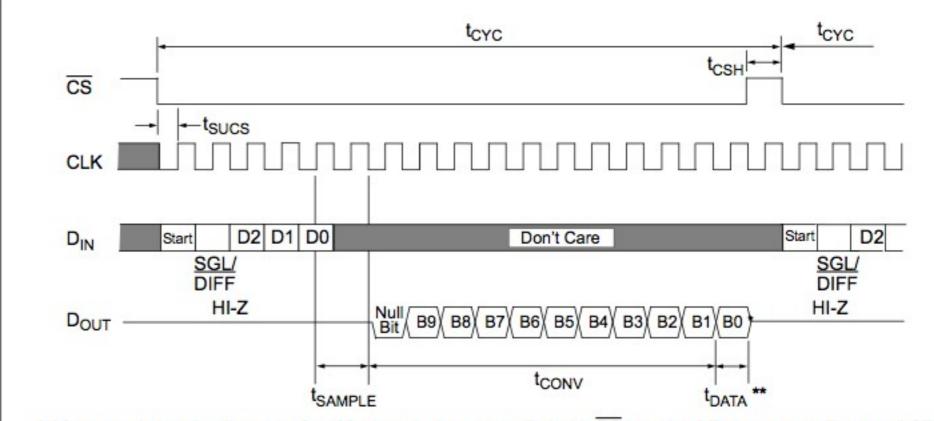

- •Ground -> Photoresistor -> Resistor -> 3.3V
- ADC input -> junction Photoresistor & Resistor
- ADC connects to SCLK, MISO, MOSI, CE0
- •8 analog inputs on one side of ADC

MCP3008 ADC

TABLE 5-2: CONFIGURE BITS FOR THE MCP3008

MICESUUO					
Control Bit Selections				Input	Channel
Si <u>ngl</u> e /Diff	D2	D1	D0	Configuration	Selection
1	0	0	0	single-ended	CH0
1	0	0	1	single-ended	CH1
1	0	1	0	single-ended	CH2
1	0	1	1	single-ended	CH3
1	1	0	0	single-ended	CH4
1	1	0	1	single-ended	CH5
1	1	1	0	single-ended	CH6
1	1	1	1	single-ended	CH7
0	0	0	0	differential	CH0 = IN+ CH1 = IN-
0	0	0	1	differential	CH0 = IN- CH1 = IN+
0	0	1	0	differential	CH2 = IN+ CH3 = IN-
0	0	1	1	differential	CH2 = IN- CH3 = IN+
0	1	0	0	differential	CH4 = IN+ CH5 = IN-
0	1	0	1	differential	CH4 = IN- CH5 = IN+
0	1	1	0	differential	CH6 = IN+ CH7 = IN-
0	1	1	1	differential	CH6 = IN- CH7 = IN+

- * After completing the data transfer, if further clocks are applied with $\overline{\text{CS}}$ low, the A/D converter will output LSB first data, then followed with zeros indefinitely. See Figure 5-2 below.
- ** t_{DATA}: during this time, the bias current and the comparator powers down while the reference input becomes a high-impedance node.

FIGURE 5-1: Communication with the MCP3004 or MCP3008.

Datasheet has all the details:

- How many bits per message
- What they all mean

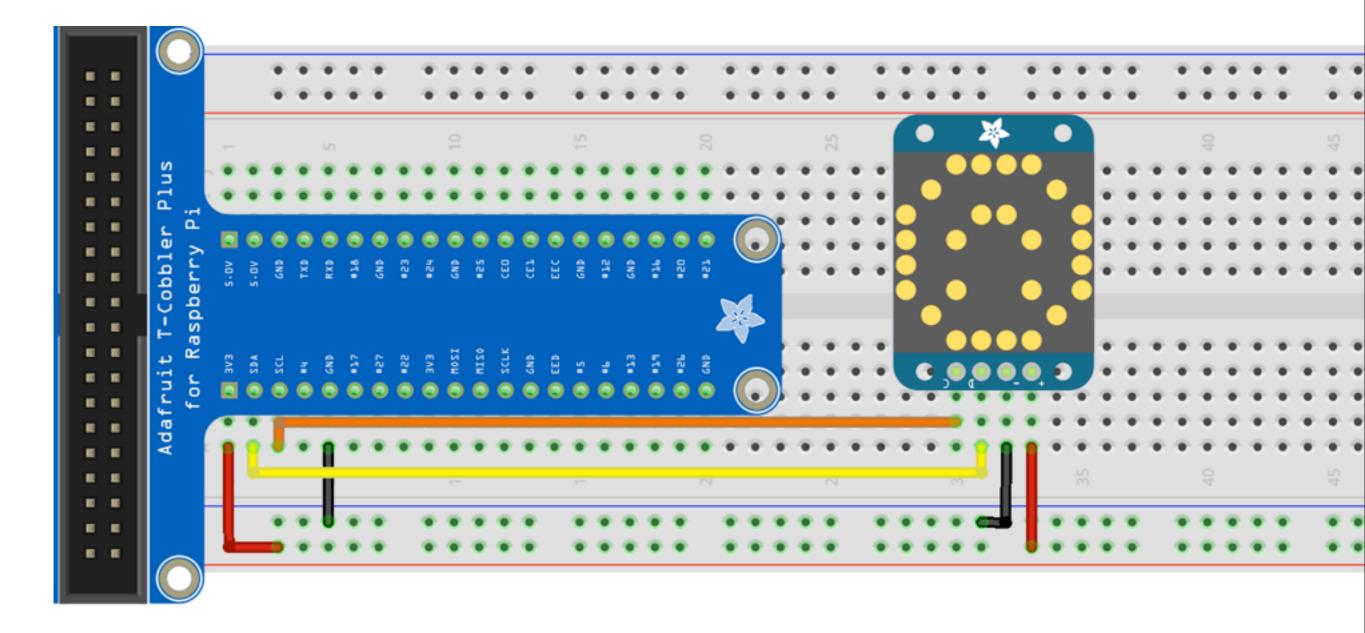

Photoresistor, ADC, & SPI

```
import spidev
import time
adc = spidev.SpiDev()
adc.open(0,0)
def readadc(channel):
  r = adc.xfer2([1, (8+channel)<<4, 0])
  adcout = ((r[1]\&3) << 8) + r[2]
  return adcout
while True:
  print(readadc(0))
  time.sleep(1)
```

Photoresistor, ADC, & SPI Breadboard to PCB

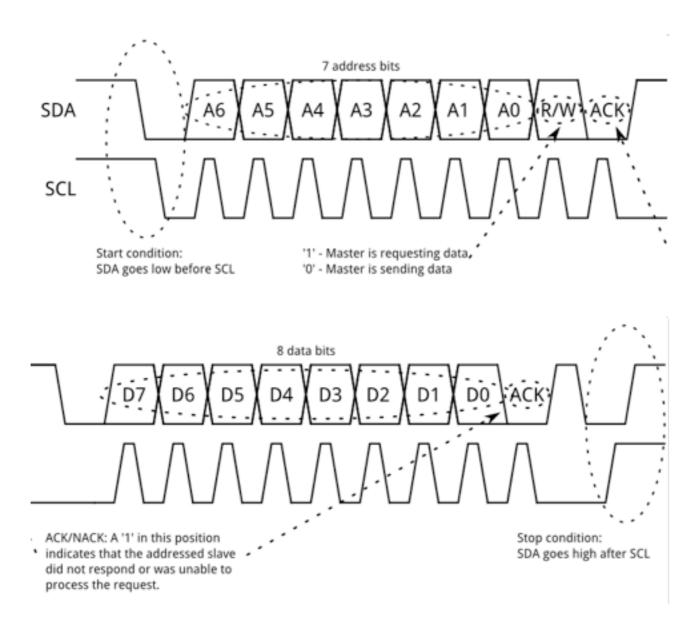

8x8 LED Matrix & I²C

- LED to Ground
- LED C to RasPi SCL
- LED D to RasPi SDA

8x8 LED Matrix & I²C

- First send the Address (7-bits)
- Then R/W Bit
- Then one byte, in the specified direction Learn More: https://learn.sparkfun.com/tutorials/i2c

8x8 LED Matrix & I²C Why use I²C?

- Fewer wires
- More devices
- Less time reading spec sheets (more standardized)

8x8 LED Matrix & I²C Setting up the RasPi

At the Linux prompt (\$), on the RasPi, run:

- \$ sudo aptitude install python-smbus i2c-tools git
- \$ git clone https://github.com/adafruit/Adafruit-Raspberry-
- Pi-Python-Code.git
- \$ cd Adafruit-Raspberry-Pi-Python-Code
- \$ cd Adafruit_LEDBackpack
- \$ sudo python ex_8x8_pixels.py

8x8 LED Matrix & I²C How does it work?

At the Linux prompt (\$), on the RasPi, run: \$ rmate ex_8x8_pixels.py

```
#!/usr/bin/python
import time
import datetime
from Adafruit_8x8 import EightByEight
# 8x8 Pixel Example
grid = EightByEight(address=0x70)
print "Press CTRL+Z to exit"
# Continually update the 8x8 display one pixel at a time
while(True):
  for x in range(0, 8):
    for y in range(0, 8):
      grid.setPixel(x, y)
      time.sleep(0.05)
  time.sleep(0.5)
  grid.clear()
  time.sleep(0.5)
```

8x8 LED Matrix & I²C How does it work?

At the Linux prompt (\$), on the RasPi, run:

- \$ rmate Adafruit_8x8.py
- \$ rmate Adafruit_LEDBackpack.py

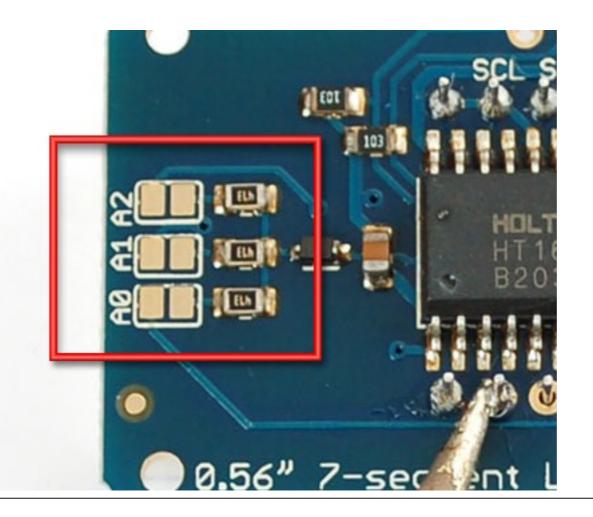

```
11 - class EightByEight:
      disp = None
      # Constructor
      def __init__(self, address=0x70, debug=False):
16 v
17
18
        if (debug):
          print "Initializing a new instance of LEDBackpack at 0x002X" % address
        self.disp = LEDBackpack(address=address, debug=debug)
    def writeRowRaw(self, charNumber, value):
        "Sets a row of pixels using a raw 16-bit value"
        if (charNumber > 7):
23
24
25
26
27
          return
        # Set the appropriate row
        self.disp.setBufferRow(charNumber, value)
      def clearPixel(self, x, y):
28
29
        "A wrapper function to clear pixels (purely cosmetic)"
        self.setPixel(x, y, 0)
```

8x8 LED Matrix & I²C Connecting More Devices

Maybe you want 2 LED Matrices.

I said that I2C supports multiple devices, but every matrix has address 0x70

Short across pads on back of LED Matrix (You will only have two pairs of pads)

Setting up a new RasPi

I did a few things for you before class:

Raspian Linux https://www.raspberrypi.org/downloads/copy to SD card

Adafruit Occidentalis Bootstrapper https://github.com/adafruit/Adafruit-Pi-Finder (IP Address, more hardware drivers)

sudo gem install rmate

More about SPI & GPIO

Adafruit also provides a Python library for the ADC \$\frac{1}{2} \text{rmate Adafruit-Raspberry-Pi-Python-Code/}{2} \text{Adafruit MCP3008/mcp3008.py}

- Doesn't use spidev, uses GPIO
- Works on any GPIO pins, but very slow
